## ***MAPPING TYPIIFICATION OF MIOMBO USING MEDIUM AND HIGHT RESOLUTION SATELLITE IMAGE (HUAMBO-ANGOLA)***

# Objetives

## 1. Objectives

## 2. Location

## 3. Metodology

## 4. Results

## 5. Conclusions

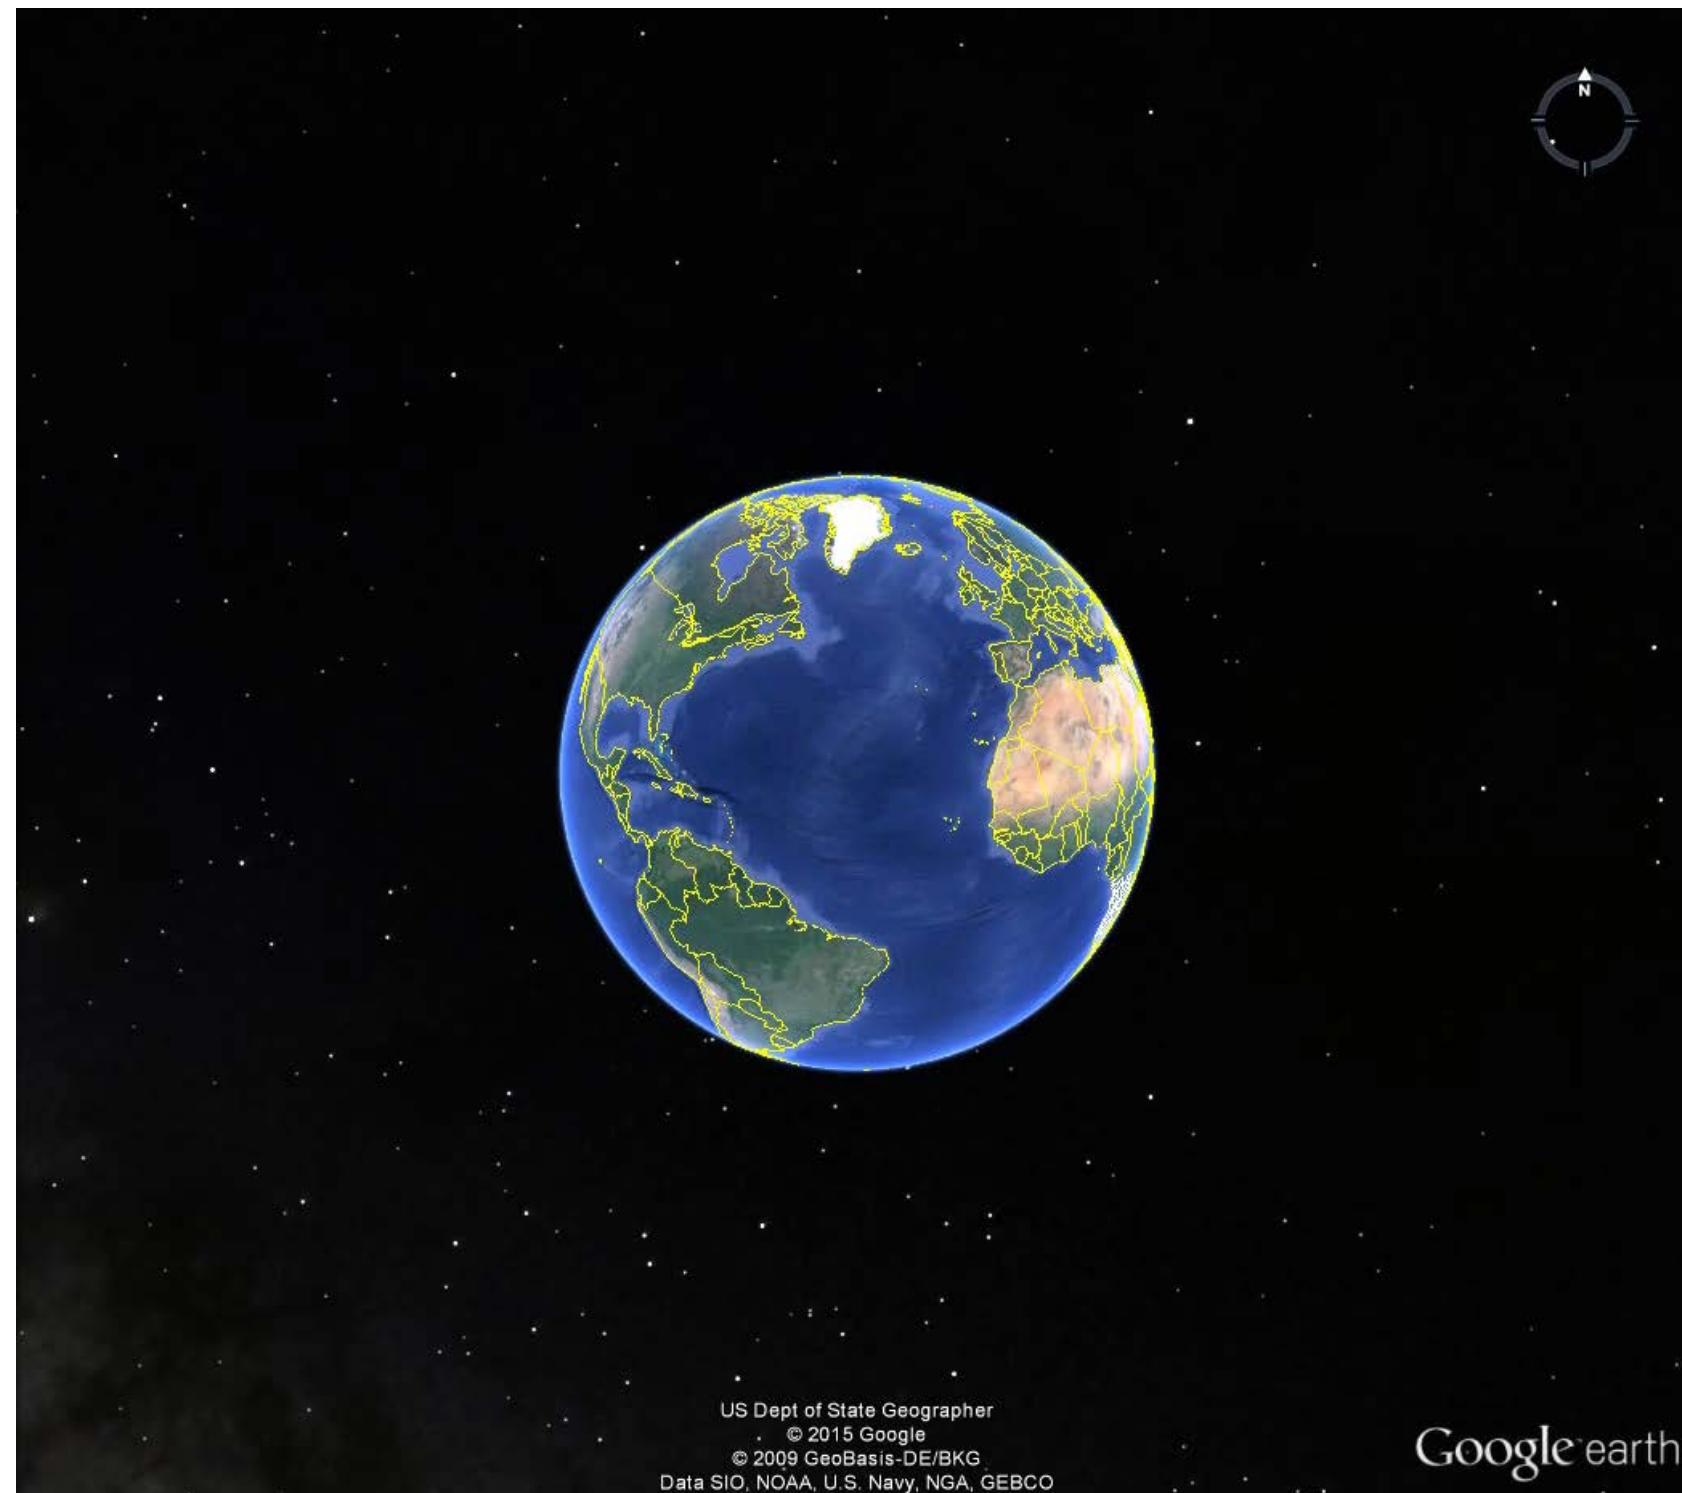

- Develop a methodology of typification of Miombo forest based on analysis of satellite images of medium and high resolution
- Elaborate the thematic mapping of typification of the Miombo in the province of Huambo (Angola).

**The result of this study will increase the knowledge of Miombo in Angola. The information is very important to obtain a model of management of these forest formations that allows a sustainable use by the local communities**

### Modified TWINSpan

Modified TWINSpan algorithms (Roleček et al. 2009) were computed through R statistics software. In this case, only the dasometric measures were used as input data.

## Geomatics Work

### Image acquisition

### Select type of satellite

The main choice of the satellite was on spatial resolution. Landsat 7 and Landsat 8 have 30 meters of spatial resolution against Setniel-2 that have 10 meters.

### Images selection with less than 5 % of clouds

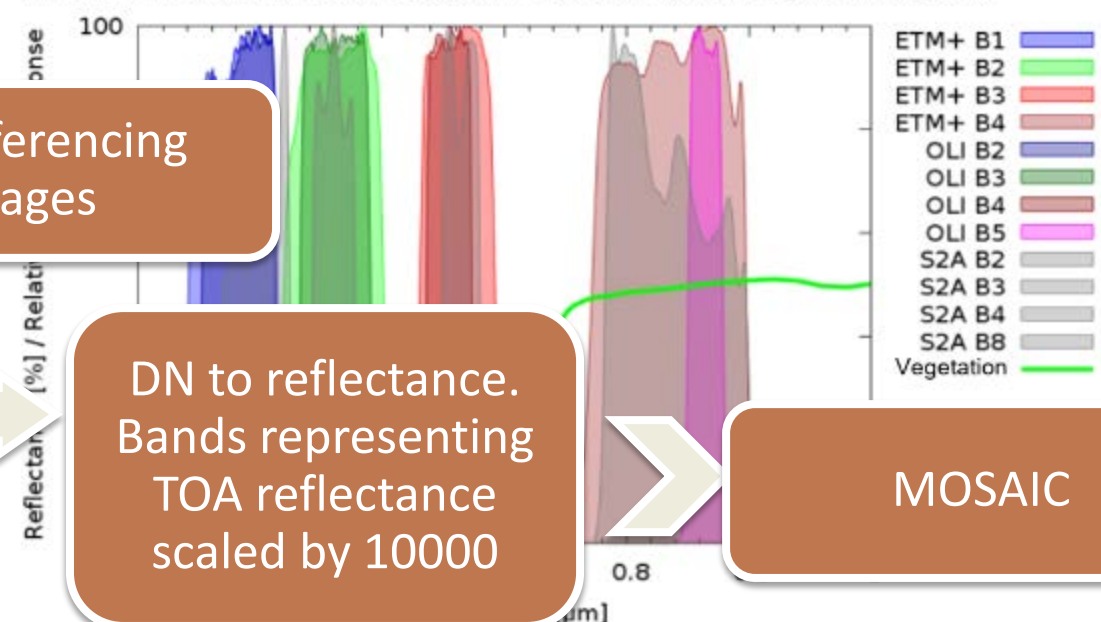

a)	Sentinel 2A	Band 1 - Coastal aerosol	0.443	10
b)	Landsat 8	Band 2 - Blue	0.490	10
		Band 3 - Green	0.560	10
		Band 4 - Red	0.665	10
c)	Landsat 8	Band 5 - Vegetation Red Edge	0.705	20
		Band 6 - Vegetation Red Edge	0.740	20
		Band 7 - Vegetation Red Edge	0.783	20
		Band 8 - NIR	0.842	10
		Band 8A - Vegetation Red Edge	0.865	20
		Band 9 - Water vapour	0.945	60
		Band 10 - SWIR - Cirrus	1.375	60
		Band 11 - SWIR	1.610	20
		Band 12 - SWIR	2.190	20

### Georeferencing images

DN to reflectance. Bands representing TOA reflectance scaled by 10000

Huambo forest (Angola)				Type 0		
Description						
Number plots:		21	Soil type:		Orthic ferralsols	
FCC (%):		49.21	Density (N. ha <sup>-1</sup> ):		2147	
Total species:		30	Shannon's Index		1.85	
Plots:		0, 1, 6, 14, 15, 19, 20, 23, 25, 27, 28, 29, 32, 34, 35, 37, 38, 43, 44, 47 and 48				
Stratum description						
The main species are composed of the genus <i>Brachystegia</i> spp., and <i>Isoberlinia angolensis</i> (Benth.) Hoyle & Brenan, being both dominant species of Miombo (Campbell <i>et al.</i> , 1996). Species diversity is smaller than in stratum 1 and 2. Most trees have a diameter of less than 7.5 cm; This may indicate that it is a type of young forest, but of a consolidated dynamics due to its diametrical distribution.						
Stand composition main species						
	Species	D	H	G	DMC	Nha <sup>-1</sup>
1	<i>Brachystegia spiciformis</i> Benth	9.21	6.69	3.71	0.098	475.69
2	<i>Brachystegia bohemii</i>	9.92	5.66	2.38	0.106	345.4
3	<i>Isoberlinia angolensis</i> (Benth.) Hoyle & Brenan	8.63	5.61	1.88	0.090	273.75
Stand composition secondary species						
	Species	D	H	G	DMC	N.ha <sup>-1</sup>
4	<i>Julbernardia paniculata</i> (Benth.) Troupin	9.68	6.23	4.25	0.102	468.78
5	<i>Albizia antunesiana</i> Harms	8.55	5.14	4.14	0.088	693.21
6	<i>Anisophyllea boehmii</i> Engl.	8.24	5.25	1.78	0.086	257.30
Density species (N.ha <sup>-1</sup> )				Other species present in the stratum		
				<i>Bobgunnia madagascariensis</i> <i>Brachystegia tamarindoides</i> <i>Brachystegia utilis</i> <i>Diplarhynchus condylocarpon</i> <i>Erythrapleum africanum</i> <i>Rothmannia engleriana</i> <i>Syzygium guineense</i> <i>Uapaca gossweileri</i> <i>Gardenia volkensii</i> <i>Hymenocardia acida</i> <i>Monotes spp</i> <i>Olea schweinfurthiana</i> <i>Parinari curatellifolia</i> <i>Pericopsis angolensis</i> <i>Pterocarpus angolensis</i> <i>Terminalia brachystemma</i> <i>Uapaca Kirkiana</i>

5. *Conclusions*

Type of miombo 0: 63 487.64 ha

Type of miombo 1: 31 913.42 ha

Type of miombo 2: 34 965.27 ha

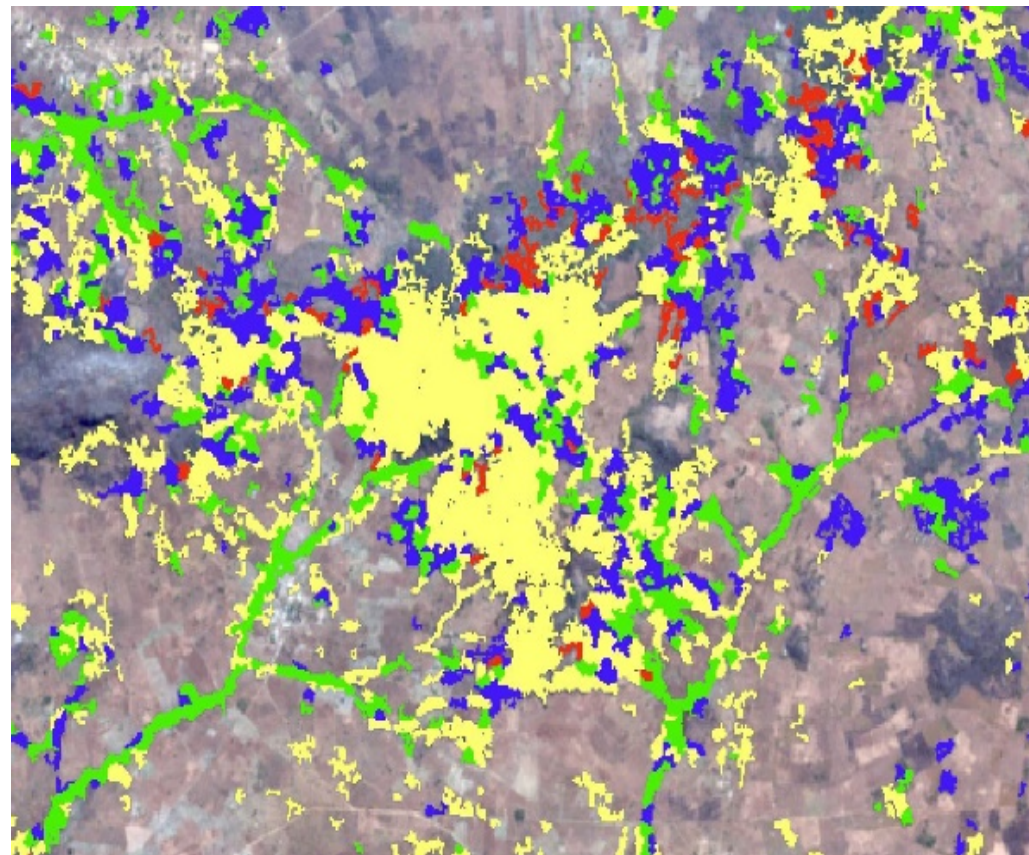

Type of miombo 3: 18 072.12 ha

Classification accuracy 46%

# Results

## Classification of miombo types

### Miombo Type 0

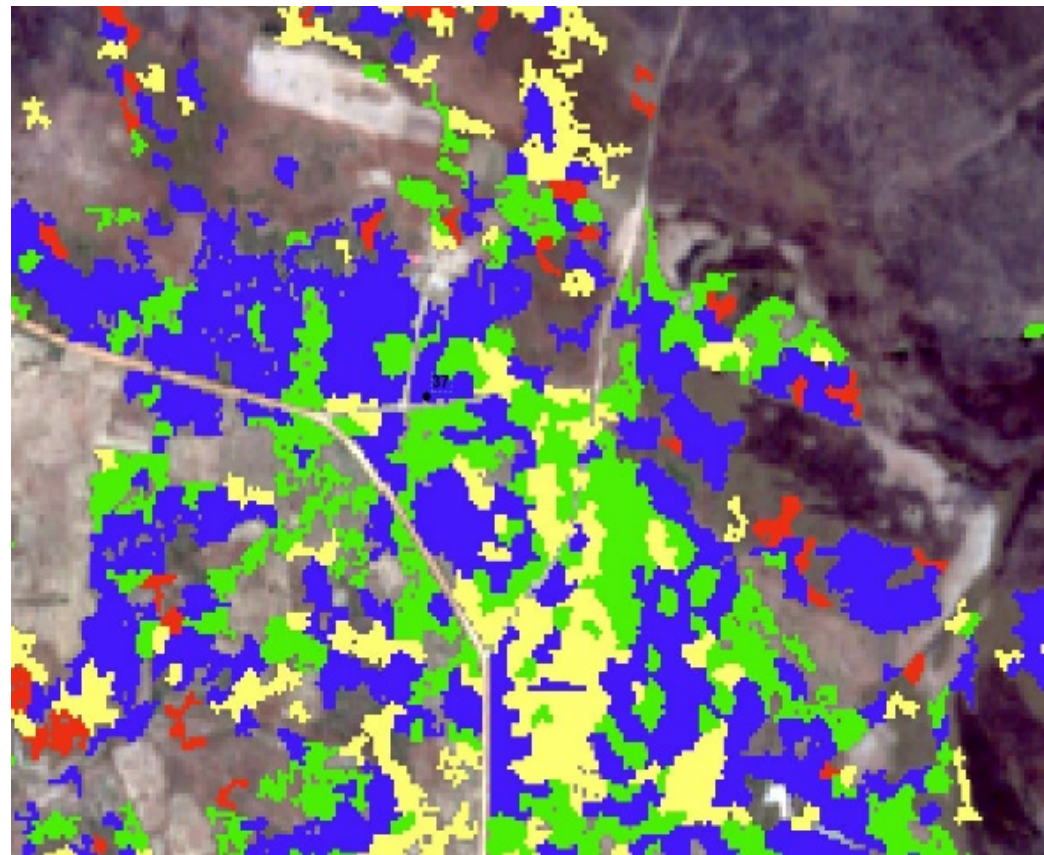

- Forest with typical features of an intermediate state between degraded and mature miombo
- The low slope makes it accessible to other traditional uses such as firewood, charcoal, the extraction of wild fruits or livestock

# Results

## Classification of miombo types

### Miombo Type1

➤ Forest intervened

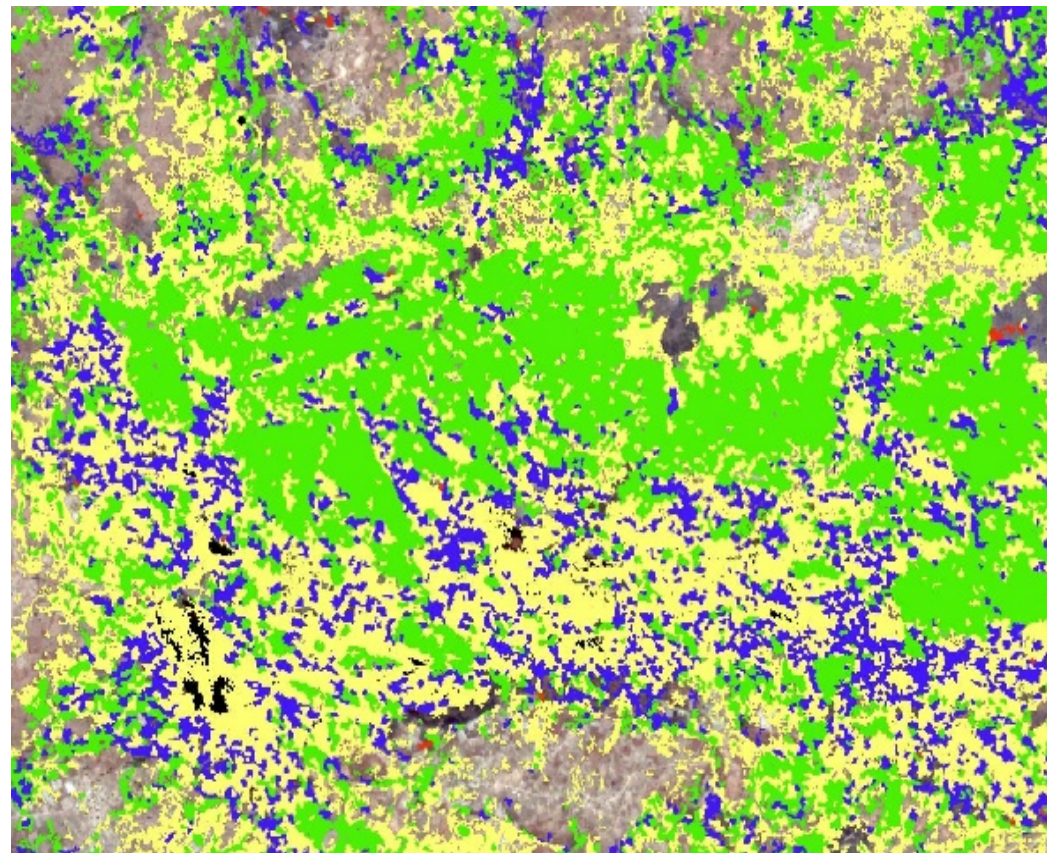

➤ Forest concentrated around the communication routes, and in areas with low slope. Easy access Of the population for the extraction of timber and non-timber resources

# Results

## Classification of miombo types

### Miombo Type 2

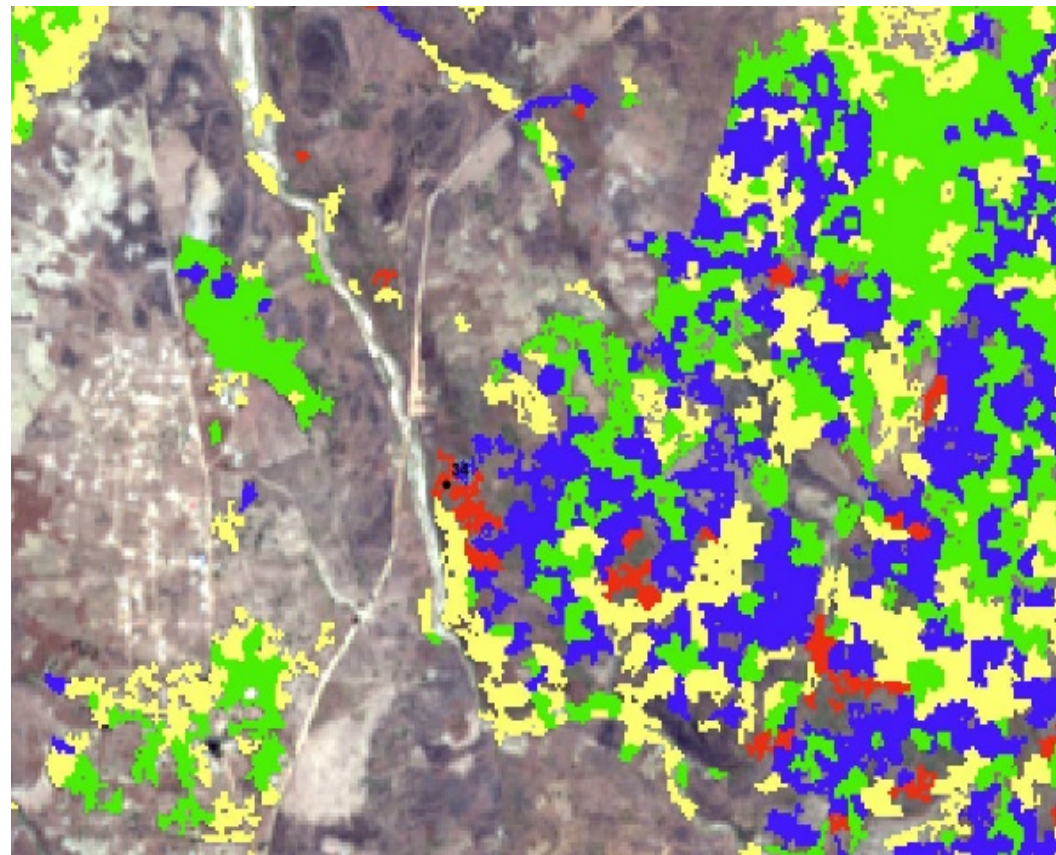

- Forest in a large space of transition towards a state with no difficult access, but with less slope and can therefore afford a greater soil thickness
- Forest in small spots, especially in the areas of greater slope or more inaccessible
- The location of this type of forest hinders human access and important logging and burning activities for later cultivation

# Results

## Classification of miombo types

### Miombo Type 3

- Forest found in the margins of the forest mass, near roads, or close to populations
- This forest presented a high degree of degradation and a lesser extend

# Conclusions

1. *Objetives*
2. *Location*
3. *Metodology*
4. *Results*
5. **Conclusions**

➤ The classification has been carried out on a single type of forest mass (miombo) so the result of the classification could be explained due to the context of the study and the reality of the data. In advanced stages of degradation, where forest cover is low, the greater presence of soil in the image would also cause a distortion of the data.

➤ A 10-by-10-meter pixel such as that of the Sentinel-2 image will probably not be a pure pixel. It will be a pixel that will mix the spectral signature of a type of miombo with that of the ground

➤ The analysis and processing of the inventory data made it possible to differentiate four types of miombo. After the exhaustive study of silvicultural characterization of the different types of miombo, it has made a classification considering this characterization and the characteristics of the study area in terms of slope, climate, spatial distribution and soil composition.
